

Lutronic Genius® Treatment Post Care Instructions

Post Treatment Instructions:

- **Function:** Towelettes included in your post peel kit provide additional stimulation of the skin and expedite the peeling process.
- **Use:** First towelette should be used 4 hours after your peel has been applied. Subsequent towelettes will be applied at intervals designated in your aftercare booklet. All towelettes should be spaced a minimum of four hours apart and all towelettes should be used in the first 48 hours.
- Once peeling discontinues towelette use.
- **Side Effects:** Towelettes are NOT refreshing towelettes. There are active ingredients in these towelettes and therefore you may note some light stinging upon application. Some people can also experience some itching, especially on night 1 which can be remedied by applying VI Derm Post-Treatment Repair Cream, hydrocortisone cream, or taking an oral antihistamine.
- As a general rule, treat it like a sunburn: avoid sun exposure. Even after the peeling has subsided your new skin will be sensitive to UV light.
- Refrain from physical activity / exercise for 72-96 hours after peel application. Including excessive perspiration can lead to PIH or blistering.
- While the skin is exfoliating avoid pulling, picking, rubbing and any premature removal of the skin. This could lead to significant irritation and possible hyperpigmentation. NEVER force or peel the skin off.
- It is recommended to wait for a minimum of 2 weeks before any treatment that creates exfoliation of the skin. (includes facials, extractions, waxing and threading)
- You can shave treated area once the peeling has completely subsided.

Protect your investment and reapply your sunscreen when outdoors.

What to Expect:

- The first two days your skin will look a little tan, bronzed, or pink. It may also feel a bit tight before the peeling begins.
- If any products in the post peel kit sting or irritate beyond your tolerance reach out to our office.
- Pigment may darken as the skin prepares to peel. THIS IS NORMAL.
- Days 3, 4, and 5 are the typical days of peeling. By day 6 most exfoliation has subsided.
- Typically, peeling begins on the third day, starting peri-oral area then peeling outward. The forehead and neck will be the last areas to peel. The skin on the body peels slower than the face; usually starting day 4-7 and taking up to 10 days or more.

FOLLOW-UP: To achieve the best results, complete the full treatment schedule at the intervals recommended by your technician.
